

iOS Development - Assignment 3

App: *Shopping List 3000*

Group name: What's our group name?

Lucky Lau, 12486989

Vong Beng, 13132372

Wen Loong (Ayden) Heng, 12802359

Problem

- Lack of a simple real-time list that can be SHARED EASILY
- Busy lifestyle (no time to explore an app), even harder to teach non-tech savvy user such as elderly. As such it is hard to coordinate and plan grocery.

Target Audience

- Everyone

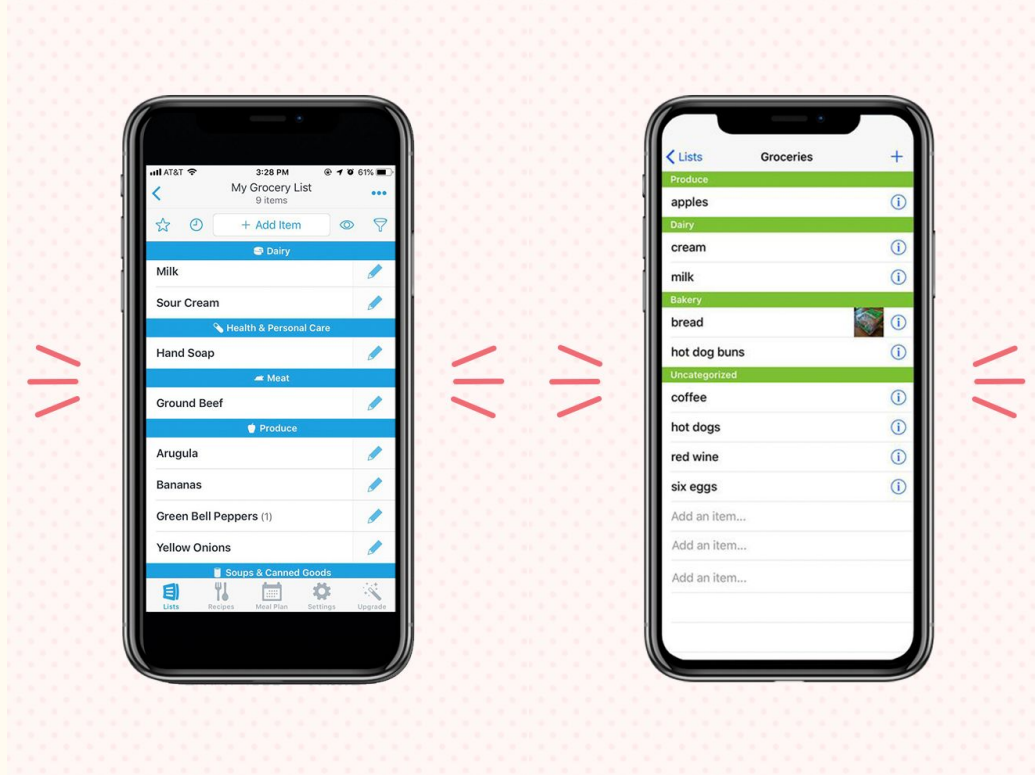

Business Model

- Freemium
 - **Feature-led Freemium** (limited functionality)
 - Free user, able to create only ONE list and share up to two users.
 - Paid user, unlimited list creation and unlimited share to other user
- User friendly interface (easy to even non-tech savvy user)

Competitors

- “AnyList”

Requires
user login

- “Our Groceries”

Shared list is
not real-time

Demo

Frameworks Used

- **Google Firebase:**

- Used for user authentication
 - Email and Password login methods used

- **Google Firestore:**

- Used for data storage

- **Firestore Data Model**

Our Firestore project contains two subcollections, `users` and `lists`.

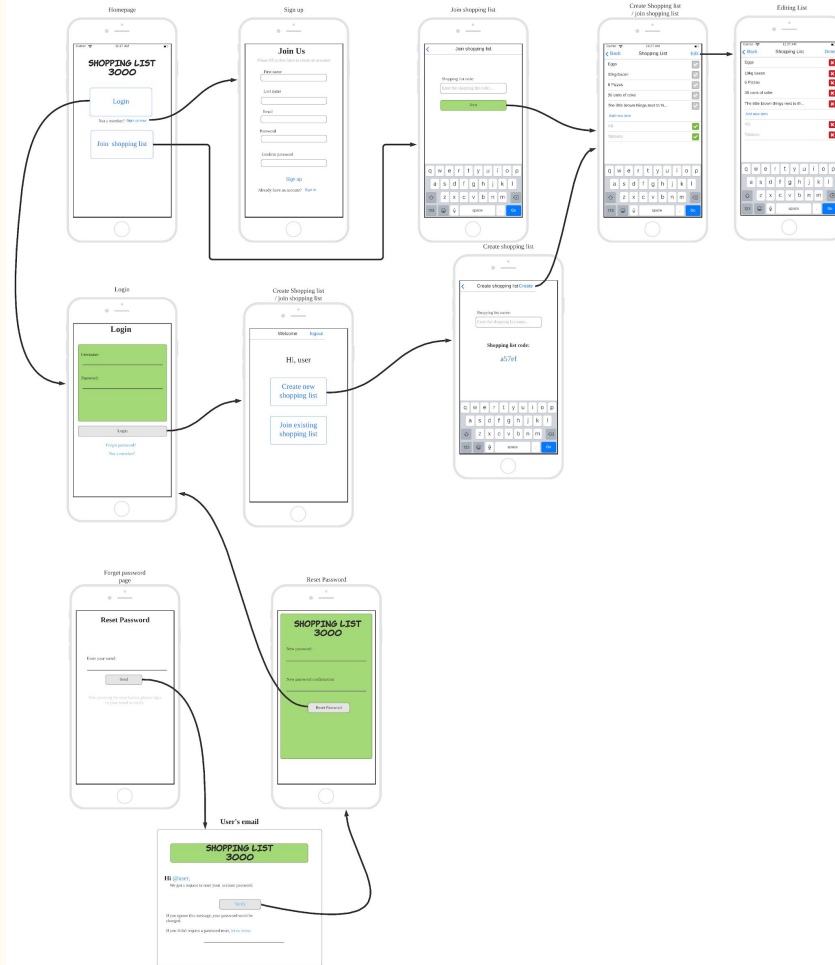

Each `user` document is identified by their email used to sign up with Firebase Authentication and has the following fields:

- `firstName` : String
- `lastName` : String
- `lists` : Array of Strings (Unique code of all lists generated by the user)

Each `list` document is identified by the unique alphanumeric code generated and has two fields:

- `listName` : String
- `items` : Subcollection of a custom object with the following fields:
 - `completed` : Bool (Indicates whether object is bought)
 - `title` : String (Name of object)

Design and Development Process

Challenges

- Designed view controllers separately
 - Resulting in **merge conflicts** and **dependencies issues**
 - Especially with **storyboard** and **Pod files**
 - Working remotely made it more difficult to resolve
